

# Representing Graphs

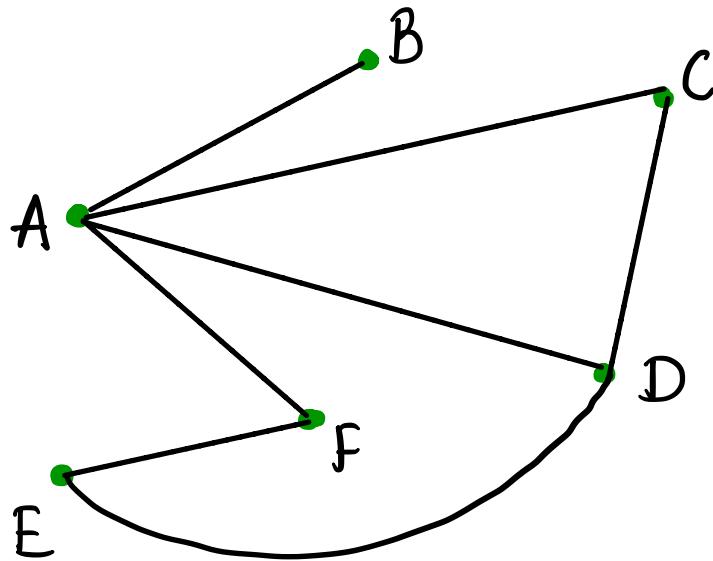

\* Adjacency Matrix Representation.

A graph  $G = \{V, E\}$  such that  $|V| = n$  can be represented by a matrix  $A$ .

$$A[i, j] = \begin{cases} 1, & \text{if } (i, j) \in E \\ 0, & \text{otherwise.} \end{cases}$$

for undirected Graph : Adjacency Matrix is a symmetric matrix.

Example :- Undirected Graph.

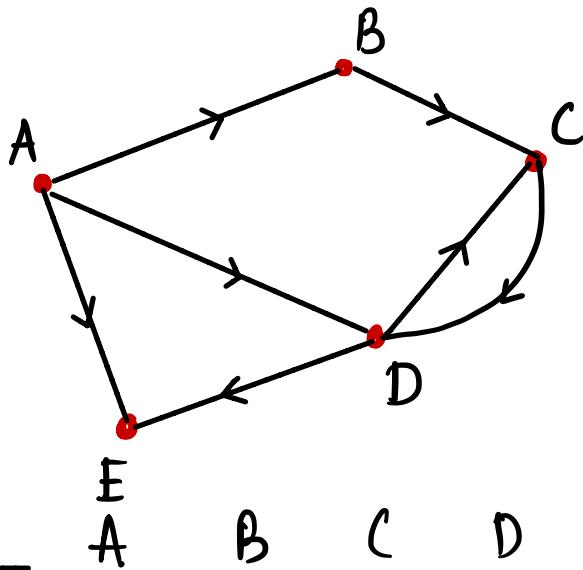

-Adjacency Matrix-

	A	B	C	D	E	F
A	0	1	1	1	0	1
B	1	0	0	0	0	0
C	1	0	0	1	0	0
D	1	0	1	0	1	0
E	0	0	0	1	0	1
F	1	0	0	0	1	0

Space complexity =  $\Theta(n^2)$

If you store half matrix still  $\Theta(n^2)$

# Directed Graph.

$(v_i, v_j)$

Edge from  $v_i$  to  $v_j$

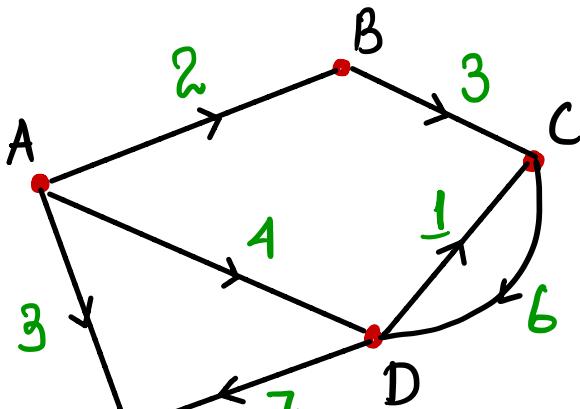

(Outdegrees)

	A	B	C	D	E	
A	0	1	0	1	1	3
B	0	0	1	0	0	1
C	0	0	0	1	0	1
D	0	0	1	0	1	2
E	0	0	0	0	0	0

(Indegrees)      0    1    2    2    2

Space Complexity =  $\Theta(|V|^2)$

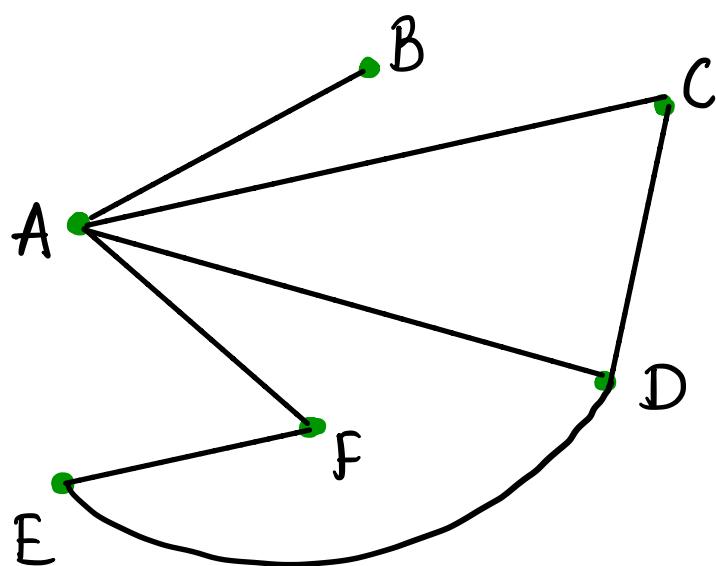

# Weighted Undirected Graph.

$$A = \begin{bmatrix} & \text{A} & \text{B} & \text{C} & \text{D} & \text{E} \\ \text{A} & 0 & 2 & 0 & 4 & 1 \\ \text{B} & 0 & 0 & 3 & 0 & 0 \\ \text{C} & 0 & 0 & 0 & 6 & 0 \\ \text{D} & 0 & 0 & 1 & 0 & 7 \\ \text{E} & 0 & 0 & 0 & 0 & 0 \end{bmatrix}$$

Most of the Cases Adjacency Matrix is Sparse (More No. of Zeros).

We can avoid storing 0s

Neighbors.

$$A \rightarrow \{B, C, D, E, F\}$$

$$B \rightarrow \{A\}$$

$$C \rightarrow \{A, D\}$$

$$D \rightarrow \{A, C, E\}$$

$$E \rightarrow \{D, F\}$$

$$F \rightarrow \{A, E\}$$

Adjacency List

Representation

Space complexity :-

$$\max(\Theta(NI), \Theta(IEI))$$

Adjacency List

# Comparison Adjacency Matrix and Adjacency List Representation of Graph.

Adjacency List (AL) representation takes comparatively less space than Adjacency Matrix (AM) representation.

To Check if  $j$  is a neighbour of  $i$

AM Representation : Check if  $A[i][j]$  is 1 or not.

AL Representation : Scan the complete adjacency list. (costly)

To find all neighbours of  $i^{\text{th}}$  vertex

AM : Scan all the columns of  $i^{\text{th}}$  row.

AL : Already Available.

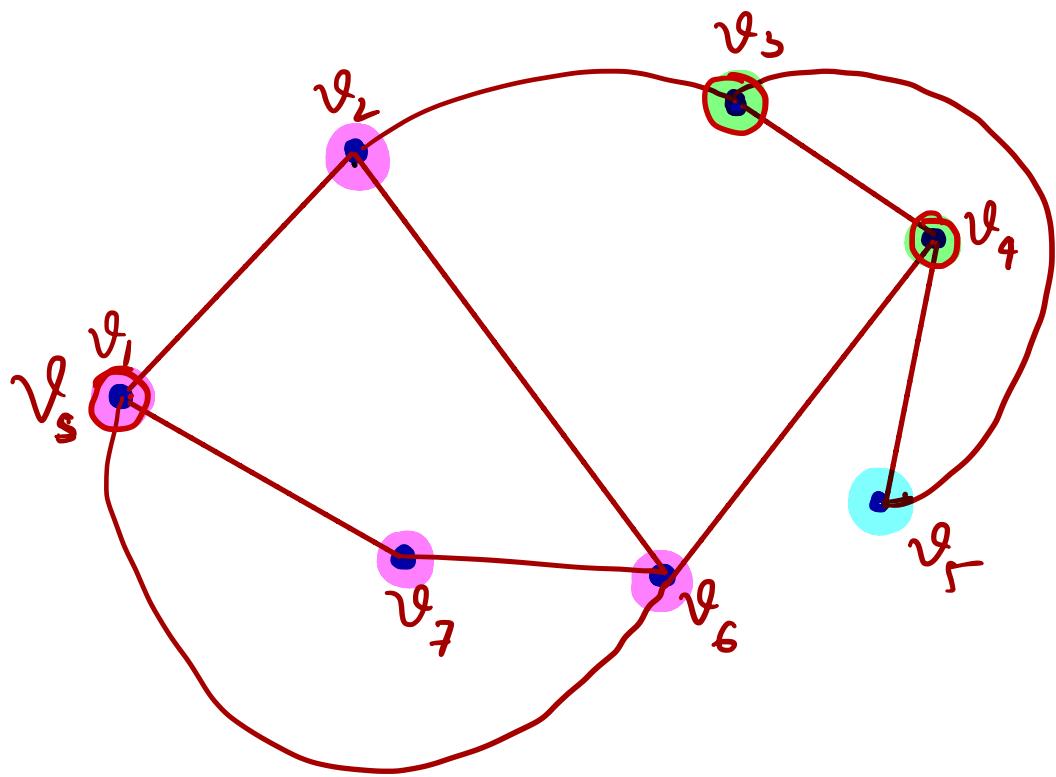

# Breadth First Search: (BFS)

An algorithm for traversing a graph.

Logic :-

Visiting each vertex  
of graph  
in a systematic  
way.

- \* Select a starting vertex  $v_s$
- \* Visit Vertices which are just one step away from  $v_s$
- \* Visit all  $v_s$  <sup>non-visited</sup> vertices which are two step away
- \* Visit all  $v_s$  <sup>non-visited</sup> vertices which are three step away from  $v_s$ .
- \* and Go On till you have no vertices left to visit.

$\{v_1, v_2, v_7, v_6\}$  (One Step Away)

$\{v_3, v_4\}$  (Two Step Away)

$\{v_5\}$  (Three Step Away)

All nodes (vertices) visited.

Input to the Algorithm : Starting Vertex.

Output of the Algorithm : Visiting every node in a connected component of the graph.

BreadthFirstSearch ( $v_s$ )

{

for (  $i = 1$  to  $n$  )

visited[i]  $\leftarrow 0$  ;

parent[i]  $\leftarrow -1$  ;

level[i]  $\leftarrow -1$  ;

endfor.

Queue Q ; // Empty Queue.

visited[s] = 1 ; // Starting Vertex is visited

Q.enqueue(s) ;

level[s] = 0 ;

while ( $!Q.\text{IsEmpty}()$ )

$j^{\circ} \leftarrow Q.\text{dequeue}();$

for each  $(j^{\circ}, k) \in E$

if ( $\text{visited}[k] == 0$ )

$\text{visited}[k] = 1;$

$Q.\text{enqueue}(k);$

$\text{parent}[k] = j^{\circ};$

$\text{level}[k] = 1 + \text{level}[j^{\circ}];$

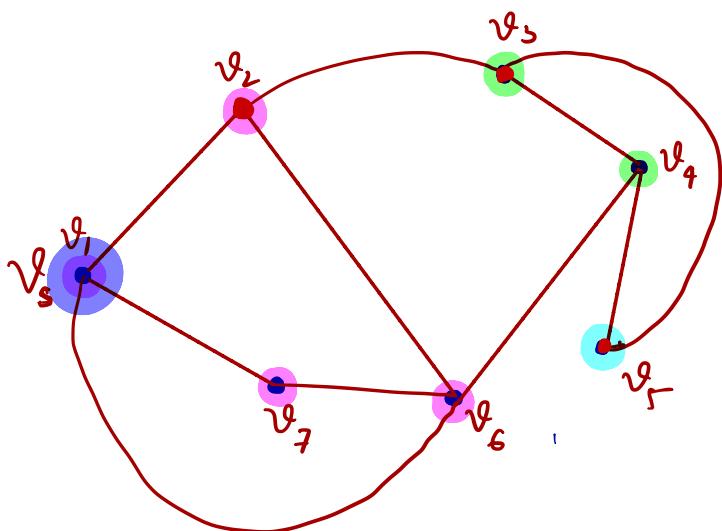

endef.

end for each.

end while

Complexity :-

$O(m+n)$

## Iteration 2 ( $j=2$ )

Q : 

2	6	7					
---	---	---	--	--	--	--	--

## Iteration 6 (j=4)

visited :	[1   1   1   1   1   1   1]
parent :	[-1   1   2   6   3   1   1]
level :	[0   1   2   2   3   1   1]
Q :	[5   ]   ]   ]   ]   ]   ]

## Iteration 7 (j=5)

visited :	[1   1   1   1   1   1   1]
parent :	[-1   1   2   6   3   1   1]
level :	[0   1   2   2   3   1   1]
Q :	[ ]   ]   ]   ]   ]   ]   ]

Observations :-

1. Each vertex in a connected graph enters exactly once in Q.
2. Each vertex, except the source vertex  $v_s$ , has a parent.
3. The traversal visits all the vertices of  $G_1$  that are reachable from ' $s$ '.
4. BFS gives the shortest path from source to each nodes in terms of no. of edges or if the weights associated with each and every edge of graph is constant.
